January 12, 1951

FARM WAGE RATES HIGHER, FARM EMPLOYMENT LOWER

Farm wage rates at the beginning of this year were 7 percent higher than a year earlier, the Bureau of Agricultural Economics reported today. The seasonally adjusted farm wage rate index was 450, slightly above the previous high reached in October 1948. The number of persons at work on farms during the week of December 24-30 was at its seasonal low. The total of 6,742,000 persons was 6 percent below a year ago and the smallest December estimate of record.

Farm wage rates have moved up with the general upward trend in prices in all parts of the economy. All types of individual rates were higher than a year ago. Increases amounted to from 5 to 9 percent with the larger increases in rates generally used in hiring workers for regular full-time employment. Hourly rates, which are commonly used for short-time seasonal workers, advanced the least. This pattern of increases is partly due to the fact that there is little demand for seasonal workers at this time. The rise in farm wage rates may also reflect the effects of farmers' attempts to keep dependable workers and meet the competition of increasing opportunities in industrial employment.

Individual wage rates, except hourly rates, also generally increased from the October 1 rates or decreased less than the usual amount. Ordinarily, these types of wage rates drop from October 1 to January 1, the slack season of the year. Hourly rates have a somewhat different seasonal pattern than other types of rates. Per hour with house rates usually drop sharply from October 1 to January 1 while per hour without board or room rates rise sharply. These seasonal patterns are due to large increases from October 1 to January 1 in the proportion of workers paid at hourly rates with house in the lower wage rate areas and large decreases in the same areas in the proportion of workers paid at hourly rates without board or room.

Farm wage rates on January 1 were also up from a year ago in all regions of the country. The increases were largest in the Middle Atlantic and East and West South Central States, where they amounted to about 9 percent. The smallest regional increase was 6 percent in the Pacific Region. Per month with board and room rates averaged under \$100 in only two of the regions where these rates are important and were very near \$100 in these regions. The average per month with house rate in the Pacific States slightly exceeded the \$200 mark. Per hour without board rates, which are reported

for all regions, averaged 79 cents or higher in 6 regions. In the South, these rates were 60 cents or lower and were lowest in the East South Central Region at 49 cents.

The number of persons working on farms during the week of December 24-30 consisted of 5,857,000 family workers and 885,000 hired workers. The total number of persons working on farms was 6 percent less than a year earlier, a continuation of the downtrend shown for most months of the year. Family workers were 5 percent fewer and there were 7 percent fewer hired workers. In comparison with a month earlier the number of family workers in late December was 20 percent less, while the number of hired workers was a little more than half as large.

Changes from a year ago in the number of family workers were fairly uniform by regions with the largest decreases in the 3 southern regions. For hired workers slight increases were shown for both the East and West North Central States. In the West North Central States, the increase over a year ago is partly due to a greater than usual decrease from November to December last year. These increases may also be the results of farmers keeping workers during the winter in order to assure a supply of labor in anticipation of a tight labor supply situation next summer. The decrease in the number of hired workers in the Pacific States was larger than for other regions but was largely a continuation of the decline shown in earlier months. However, the holiday during the survey week and some unfavorable weather may have helped hold down the number of hired farm workers employed.

Work on farms during the week of December 24-30 was restricted to necessary chores in many parts of the country. The inclusion of Christmas Day in the week also probably tended to limit work done. In the Northeast and North Central Regions, weather was cold and snowy. Very little outdoor work was possible although some reports of corn picking were received for the East North Central States. In most States of the Middle Atlantic Region, there was little accomplished beside chores. Some tobacco was being prepared for sale in Kentucky in anticipation of the reopening of markets after the first of the year. In Florida, less than usual amounts of labor were needed in vegetable areas due to loss of crops from earlier freezes. Citrus harvest was in full swing. In Alabama, farmers were plowing for potatoes in the Baldwin County area. Some field work was being done in Kansas where weather was mild. However, in Oklahoma and Texas, dry soils restricted field work despite mild weather. In southern New Mexico, farmers were preparing land for cotton. Cotton harvest was about completed in Arizona and there was a lull in vegetable crop activities. In California, cotton picking was nearly completed but was being delayed by weather. The usual work was in progress in vegetable and citrus areas. Pruning of deciduous fruit orchards was being delayed because of warm weather.

WAGE-RATE REVISIONS

This issue of Farm Labor contains wage rates, on the new basis, for 1948, 1949, and 1950, by States. Minor revisions have been made in the hourly composite rates for 1948, 1949, and 1950. The revisions are due to slight changes in weights derived from data which were not available at the time of the general revisions of the wage rate series a year ago.

The revisions for 1910-48 by regions were published in Farm Labor for December 1950. Revisions by States are being released in a special report and are available on request.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

DEFINITIONS AND EXPLANATIONS

Employment

Farm employment estimates of the Bureau of Agricultural Economics cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms. Interview surveys of farmers are used less frequently to provide bench mark data on employment. The survey week for the mailed questionnaire each month is the last complete calendar week in the month except when that week includes the last day of the month; in that case, the survey week is the next to the last full calendar week.

Employment concepts

All farm operators are counted as employed if they spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business. Members of the operator's family or household doing unpaid farm work, or chores, are counted if they put in 15 hours or more during the survey week. Operators plus unpaid members of their families or households who meet these criteria of employment are called family workers. All persons doing one or more hours of farm work or chores for pay during the survey week are counted as hired workers. Members of the operator's family doing farm work for cash wages are counted as hired workers. Croppers are considered family workers when working on their own crops, but hired workers when doing farm work for pay off their own tracts. If a person is employed both as a family worker and a hired worker during the week on the same farm he is counted as a hired worker.

Comparability with other data

The data on farm employment published by the Bureau of Agricultural Economics differ from those on agricultural employment published by the Bureau of the Census in the Monthly Report On The Labor Force. The Bureau of Agricultural Economics collects information from the employer (the farmer) who reports the number of persons working on his farm during the week, regardless of the other jobs held by those workers. The Census data, on the other hand, are obtained through interviews with approximately 25,000 farm and nonfarm households with the housewife or some other member of the household reporting on the labor force status of the household members. They relate only to persons 14 years of age and over, who are in the civilian population and not in institutions.

The difference between the BAE and the Census data is attributable mainly to the different treatment of three groups of workers. Children under 14 years of age who meet the criteria of employment are included in

the BAE estimates, but not in the Census Bureau's. It is estimated that this number may reach a summer peak as high as two million. Persons working on more than one farm during the survey week are counted only once by the Census Bureau, but they are counted by the BAE on each farm where they work and meet the minimum hour requirements. This group is also more numerous during the harvest season when the demand for farm labor is greatest. The additional count of workers attributable to this duplication is estimated at a minimum of a quarter of a million and may be considerably larger. The third group is composed of persons who work in both agricultural and nonagricultural employment, but work longer at the nonagricultural job; they are classified by Census as working in nonagricultural employment, but by BAE as working on a farm. This last group may range from one-half million to a million in different seasons of the year.

Other groups counted by the BAE but not by the Census Bureau are imported foreign workers and some migratory workers not living in private households. On the other hand, the Census Bureau includes in its estimates of agricultural employment certain classes of workers which the BAE does not include. Persons with "nonfarm" occupations who are working on farms, such as bookkeepers and typists, some persons in certain agricultural processing activities, and farm operators with no other job who did no farm work are considered as employed in agriculture by the Census Bureau but are not included by the BAE in its estimates of agricultural employment.

Because the volume of agricultural employment is affected by changes both in season and in weather, the difference in the week of the month for which the data are collected may also make some difference. The BAE data relate to the last full calendar week ending at least one day before the end of the month while the Census Bureau information relates to the week containing the 8th of the month.

The BAE estimates farm employment from current reports made by a selected group of farmers adjusted to enumerative survey bench mark data. The Bureau of the Census bases its figures on a sample of dwelling units. Accordingly, the figures in both cases are subject to a sampling variation and may differ from the results of a complete census.

Wage rates

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality. The "at this time" on the average probably represents the second or third day before the end of the month.
